In the presence of the delta subunit, RNAP displays an increased specificity of transcription, a decreased affinity for nucleic acids, and an increased efficiency of RNA synthesis because of enhanced recycling (By similarity). SUBUNIT: RNAP is composed of a core of 2 alpha, a beta and a beta' subunits. The core is associated with a delta subunit and one of several sigma factors (By similarity).

forming multiprotein complexes, which are required to maintain the transcriptionally repressive state of homeotic genes throughout development. PGG proteins are not required to initiate repression, but to maintain it during later stages of development. They probably act via the methylation of histones, rendering chromatin heritably changed in its expressibility. Component of the Esc/Ez) complex, which methylates Lys-9 and Lys-27 residues of histone H3. Although not sufficient to methylate histone H3 by itself, it probably represents the catalytic subunit of the Esc/Ez) complex. The Esc/Ez) complex, which may recruited to DNA by Pho, is necessary but not sufficient to recruit a functional PG repressive complex that represses target genes, suggesting that the recruitment of the distinct PRC1 complex is also required to allow a subsequent represses target genes, suggesting that the recruitment of the Esc/Ez) complex is also required to Su(z)12, Rpd3, Caf1 and probably Pho. This complex is distinct from the PRC1 complex, which contains many other PcG proteins like interact together during the first 3 hours of development to establish PcG silencing.

-I- SUMILARITY: Contains 1 SANT domain.

SIMILARITY: Contains 1 SANT domain.
